COURSE CODE: CSA1418 **COURSE NAME: Compiler Design**

Experiment 3: Lexical Analyzer to Ignore Whitespaces and Comments Using FLEX

Aim:

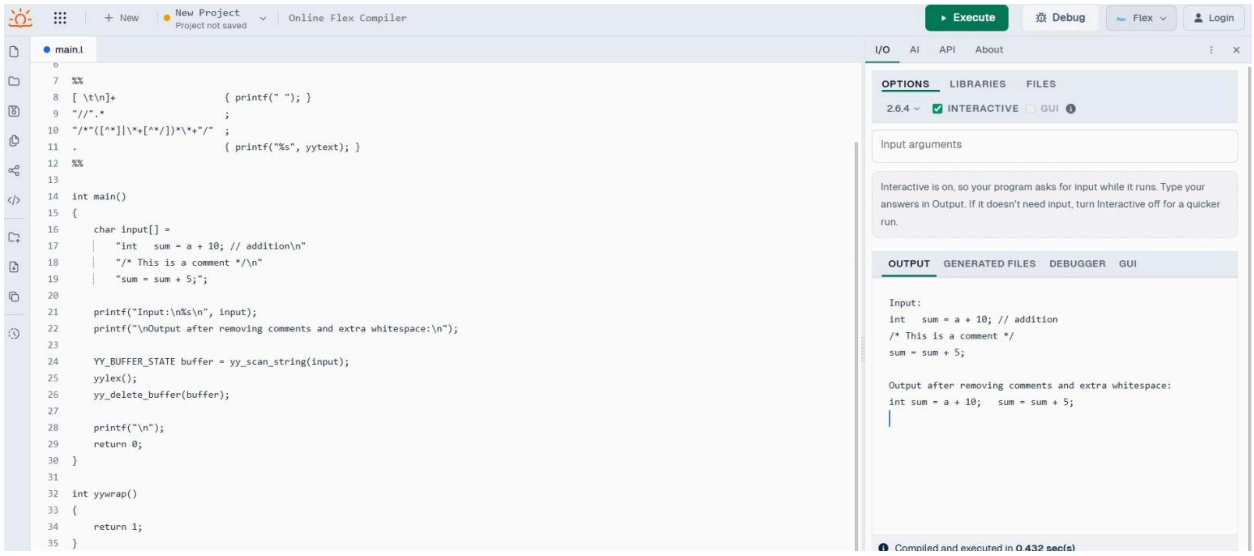

To design a lexical analyzer using FLEX that ignores redundant spaces, tabs, newlines, and comments.

Software Used: JDoodle Online FLEX Compiler.

Algorithm / Procedure:

- Open the JDoodle Online FLEX Compiler.
- Write the FLEX program to remove redundant whitespace and comments.
- Initialize the sample input containing spaces, tabs, newlines, and comments.
- Ignore whitespace characters using appropriate FLEX rules.
- Identify and skip single-line and multi-line comments.
- Display the input after removing comments and redundant whitespace.
- Compile and execute the program.
- Verify the output.

Execution Screenshot:

Result:

Thus, the lexical analyzer was implemented and executed successfully using FLEX to remove comments and redundant whitespace from the given input.
