COURSE CODE: CSA1418 **COURSE NAME: Compiler Design**

Experiment 4: Lexical Analyzer to Validate Arithmetic Operators Using FLEX

Aim:

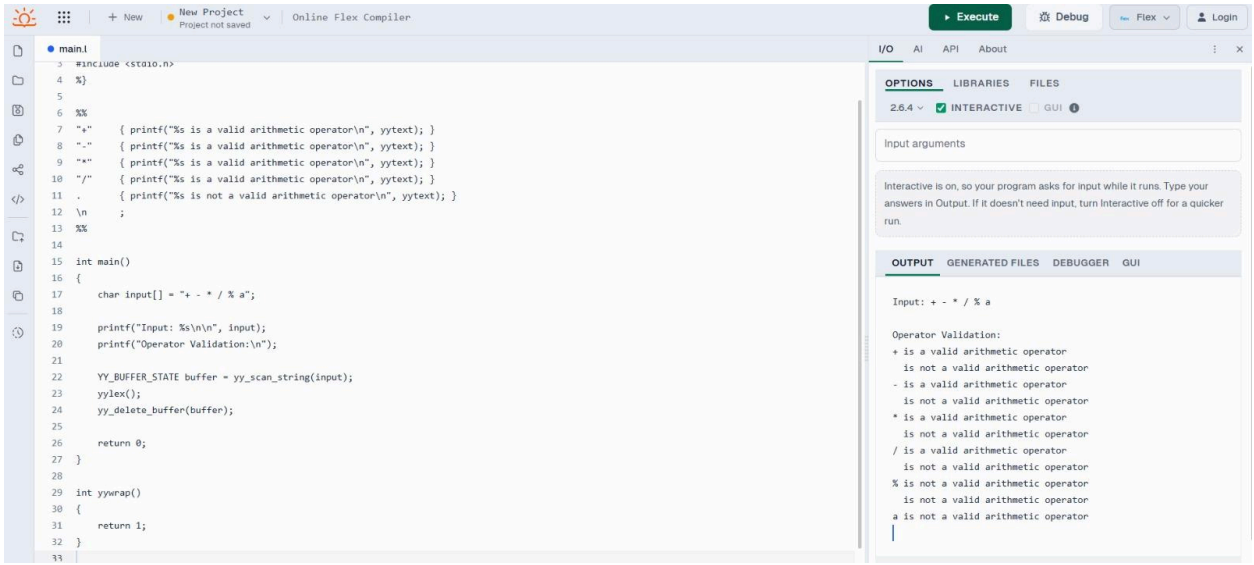

To design a lexical analyzer using FLEX to recognize and validate the arithmetic operators `+`, `-`, `*`, and `/`.

Software Used: JDoodle Online FLEX Compiler.

Algorithm / Procedure:

- Open the JDoodle Online FLEX Compiler.
- Write the FLEX program to recognize arithmetic operators.
- Initialize the sample input containing valid and invalid operators.
- Define FLEX rules to recognize `+`, `-`, `*`, and `/`.
- Display valid arithmetic operators and identify invalid characters.
- Compile and execute the program.
- Verify the output.

Execution Screenshot:

Result:

Thus, the lexical analyzer was implemented and executed successfully using FLEX to identify valid arithmetic operators and reject invalid characters.
