Lab Programs

COURSE CODE: CSA1418 **COURSE NAME: Compiler Design**

Experiment 5: Lexical Analyzer to Count Whitespaces and Newline Characters Using FLEX

Aim:

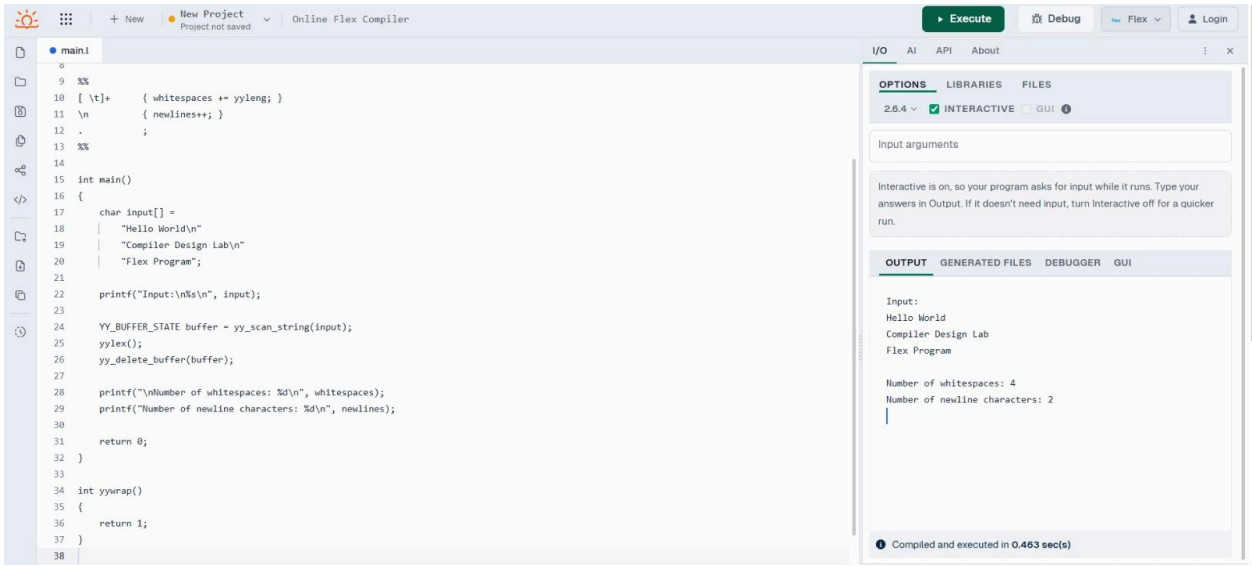

To write a FLEX program to count the number of whitespace and newline characters in the given input.

Software Used: JDoodle Online FLEX Compiler.

Algorithm / Procedure:

- Open the JDoodle Online FLEX Compiler.
- Write the FLEX program to count whitespace and newline characters.
- Initialize the sample input containing spaces and newlines.
- Use FLEX rules to count spaces and tabs.
- Count each newline character separately.
- Display the total number of whitespace and newline characters.
- Compile and execute the program.
- Verify the output.

Execution Screenshot:

Result:

Thus, the FLEX program was implemented and executed successfully to count the whitespace and newline characters in the given input.
